

PATENT

Docket No. 511582003500

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In the application of:

Mary FARIS, et al.

Serial No.: 09/809,638

Filing Date: March 14, 2001

For: 125P5C8: A TISSUE SPECIFIC
PROTEIN HIGHLY EXPRESSED IN
VARIOUS CANCERS

Examiner: Alana M. Harris, Ph.D.

Group Art Unit: 1642

**DECLARATION OF MARY FARIS, PH.D.
CONCERNING NORMAL TISSUE EXPRESSION**Assistant Commissioner for Patents
Washington, D.C. 20231

Dear Sir:

I, Mary Faris, declare as follows:

1. I hold the position of Group Leader-Target Validation at Agensys, Inc. This position requires me to generate *in vitro* models for the study of cancer, and to investigate the effect of specific genes and gene products on tumor development, growth, and progression. This position also requires me to attend national and international conferences addressing issues in cancer research, conferences where established as well as cutting edge ideas are presented. I have a Ph.D. in Immunology and Microbiology from Ohio State University. In addition, I have held two postdoctoral fellowships, one at the University of Virginia and one at the University of California at Los Angeles, School of Medicine. I have worked in the field of molecular biology

academically and professionally for over 15 years. A copy of my *curriculum vitae* is attached as Exhibit A.

2. This submission is made in support of the proposition that targeted antitumor therapies are useful even when the targeted protein is expressed on normal tissues, what is more even if the normal tissue is from a vital organ. A vital organ is one that is necessary to sustain life, such as the heart or brain. A non-vital organ is one that can be removed whereupon the individual is able to survive without artificial life support. Examples of non-vital organs are ovary, breast, and prostate. The expression and targeting of two exemplary proteins will be discussed, HER2/neu and epidermal growth factor receptor (EGFR).

3. Herceptin® is an FDA approved pharmaceutical that has as its active ingredient an antibody which is immunoreactive with the protein known synonymously as HER2, HER2/neu, or erb-b-2. It is marketed by Genentech and has been a commercially successful antitumor agent. Herceptin sales reached almost \$400 million in 2002 (see Exhibit B). The success of Herceptin is indicated by both the volume and trend of its sales figures. During the period it has been marketed, its sales numbers have consistently increased.

4. Herceptin is FDA approved as a treatment for HER2 positive metastatic breast cancer (see Exhibit C). However, the expression of HER2 is not limited to such tumors. The same protein is expressed in a number of normal tissues.

5. The diverse expression of the HER2/neu protein is indicated in Exhibit D.¹ Exhibit D provides data panels for three different GenBank deposits of HER2/neu sequence. The comparative data in Exhibit D show levels of HER2 above the median in numerous normal tissues. In particular, attention is called to the levels present in kidney and heart. The levels in

kidney are consistently shown as higher than those in heart. It is emphasized that these values are for normal tissue; thus these tissues are present in *all human recipients* of Herceptin.

6. The expression of HER2/neu in a diverse array of normal and malignant tissues was corroborated by studies conducted at Agensys, assignee of the present case, by use of RT-PCR (Exhibit F). Again, significant expression of HER2/neu was noted in heart and kidney. Further corroboration of normal expression of HER2/neu by immunohistochemistry is set forth in Exhibit G. In Exhibit G, positive staining for the presence of HER2/neu was found in normal kidney and colon tissue. Additional confirmation of the presence of HER2/neu in normal kidney is provided by Latif, et al.² As shown in this article (which evaluated whether renal cell carcinoma should be a preferred indication for anti-HER2 antibodies such as Herceptin), both protein and mRNA are produced in benign renal tissues. Notably, HER2/neu protein was strongly overexpressed in benign renal tissue (see page 8, left hand column last paragraph of Latif, et al.).

7. Despite the fact that HER2/neu is expressed in vital organs such as heart and kidney, Herceptin is very useful, FDA-approved, and commercially successful. The effect of Herceptin on cardiac tissue, i.e., "cardiotoxicity," has been a limited side effect to treatment. When patients were treated with Herceptin alone, a very low percentage of patients had any significant cardiotoxicity.

8. Of particular note, although the data shows that kidney tissue exhibits even higher expression than cardiac tissue, nephrotoxicity has not been an appreciable side effect of Herceptin treatment at all. In fact, of the diverse normal tissues in which HER2 is expressed,

¹ The expression data in Exhibit D was established using gene chip technology; see Su, et al, *PNAS Proc. Natl. Acad. Sci. USA*, Vol. 99, Issue 7, 4465-4470, April 2, 2002, Exhibit E. The results for HER2 are available on the GNF Gene Expression Atlas website <http://expression.gnf.org/cgi-bin/index.cgi>.

² Latif, Z., et al., *B.J.U. International* (2002) 89:5-9 (Exhibit H)

there is very little occurrence of any side effect. Only cardiac tissue has any appreciable side effect at all. A tissue such as kidney, where HER2/neu expression is appreciable, has not been the locus for any side effect.³

9. Taken together, this documentation establishes that production of a target protein such as HER2/neu on normal tissue, even vital normal tissue, does not defeat the utility of the protein as a therapeutic for certain tumors in which the protein is also expressed.⁴ Such physiologic outcomes, where there is normal tissue expression of a cancer-associated protein target, are not unique to HER2/neu as will be discussed below.

10. Several anti-cancer therapeutic products that target the epidermal growth factor receptor (EGFR) are presently in clinical evaluation.⁵ The small molecule product Iressa® received FDA approval⁶ in May 2003. The rationale for EGFR-targeted anti-cancer treatments is both well known and well accepted.⁷

11. One EGFR-targeted anti-cancer treatment composition is Erbitux™ (also known as cetuximab or C225). The active ingredient in Erbitux is an antibody which is immunoreactive with the EGFR. Erbitux antibody has been shown to block the proliferation of various cancer cells.⁸ The successful use of Erbitux is shown, for example, by a March 2003 \$60 million commercialization payment (Exhibit K), as well as very exciting European clinical trial data disclosed in early 2003.⁹ This data indicated that Erbitux was able to *affect shrinkage of tumor*

³ See Exhibit C, the product information for Herceptin® for an overview of side effect issues

⁴ This is particularly true where the target protein, as with HER2/neu is expressed at higher levels in tumor cells relative to normal tissue. In one embodiment, overexpression in tumor tissue can provide for altered, e.g., enhanced, protein availability for antibody binding.

⁵ Baselega, J., Oncologist 7 (supp. 4):2-8 (2002) (Exhibit I)

⁶ Iressa attaches itself to the EGF receptor inside the cell, which blocks the activation of tyrosine kinase, and switches off the signals from the EGFR.

⁷ Id.

size by 50%. Tumor size was decreased by 50% in 11% of patients who received Erbitux as a single agent and in 23% of patients who received Erbitux in combination with chemotherapy.¹⁰ In addition, tumor progression was delayed and life span appeared to be increased in the treated cancer patients. These are significant findings for a patient population with dire prognosis, few if any treatment options, and very short life expectancy.

12. EGFR is therefore being used and evaluated as a target for treatment of patients with breast, head and neck, lung, kidney and prostate cancer.¹¹ However, the expression of EGFR is not limited to such tumors. This protein is expressed in a diverse array of normal tissues.

13. EGFR protein is extensively expressed in adult humans. It is present on all epithelial and stromal cells, select glial and smooth muscle cells,¹² oral and laryngeal mucosa¹³; brain,¹⁴ liver,¹⁵ prostate,¹⁶ placenta;¹⁷ stomach and colon;¹⁸ and, skin.¹⁹ It is to be noted that since it is expressed in these normal tissues, EGFR is present in all human recipients of any EGFR-targeted therapy.

14. Despite the fact that EGFR is expressed in numerous normal tissues, including vital tissues such brain and colon, therapeutics that target EGFR are very useful and are in active development. The only significant side effect of such therapeutics has been on skin as an

acneiform rash.²⁰ This has merely been a side effect to treatment. This side effect is so minor that it is used as an indication that therapeutically effective dosage levels have been achieved.²¹ Notably, the side effect is actually capitalized on as a relatively innocuous signal that an individual has achieved a therapeutically effective dose.

15. The data on EGFR establishes that production of a target protein such as EGFR on normal tissue, even vital normal tissues, does not preclude the utility of the protein as a therapeutic for certain tumors in which the protein is also highly expressed.²²

16. Thus, targeted antitumor therapies are useful even when the targeted protein is expressed on normal tissues, even normal vital organ tissues. The ability to use a cancer-associated protein in this manner is not unique to any particular protein. The existence of expression of a protein on a normal tissue, even a vital organ tissue, still allows for meaningful and successful use of that protein as a therapeutic target.

17. I declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further, that these statements are made with the knowledge that willful, false statements and the like so made are
